

A Same world update, different authorization

S0: A wins selector q | refresh | S1: B wins q; A remains action-valid

PRESERVE

"Choose q now; refresh;
then act on it."

bind at S0
 $d(r) = A$

authorized target
A

REEVALUATE

"Refresh first; then choose q
and act."

defer to S1
 $d(r)$ unbound

authorized target
B = q(S1)

B Lifecycle representation

instruction + initial state S0

Lifecycle compiler

learn mode + bound identity

Reference contract L(r)

mode | ID | selector | validity | fallback

Mutation boundary

actor or gate; enforce action validity
